

When I was given prog3.java I thought there was nothing wrong with it at first, then when looking back in my notes I found that this is a great example of horrible cohesion, due to that the location functions had nothing to do with the MyReader class at all. So when remaking it, all I had to do was separate the classes making it so the each class was designed with a single, well- focused purpose making the cohesiveness of the class's a all time high!
